

ABSTRACT OF THE DISCLOSURE

A data processing system comprises at least a client,
a control process unit and a customization unit. The

5 control process unit is configured to execute a control
process that enables access to the system from the client.

The control process is based on a decision-tree. The
decision-tree is comprised of inter-linked decision nodes.

The customization unit is coupled to the control process

10 unit. The customization unit determines from user-

information a user entry decision-node and the

customization unit configures the control process to enable

the user to access the system from the client at the user
entry decision-node.
